

Executive Summary

We propose designing a **full-featured SaaS SMM (Social Media Marketing) panel** that meets modern standards and integrates requested capabilities. Key elements include compatibility with PerfectPanel APIs (for easy expansion), multi-provider service import, bulk category/service management, social logins, CAPTCHA, advanced user/admin dashboards, Indian payment gateways (Paytm, BharatPay, Razorpay), a robust ordering system (with sorting and icons for platforms), order history with refill/cancel options, smart API order routing, support ticketing, detailed reseller API docs (v2 with token auth), secure user profiles and deposits, and comprehensive admin controls (user/service management, SEO, notifications, theming, etc.). The system will be extensible, secure (2FA, RBAC, input validation ¹), and scalable (microservices-friendly ²). Below is a structured specification/prompt for developers and AI systems to implement this SMM panel.

Functional Requirements

- **API Integration (PerfectPanel-Compatible):** Support PerfectPanel-style APIs (v1/v2) for all order actions (services, add_order, status, balance). Include optional “mass orders” endpoint for bulk ordering. Provide API key/token generation for resellers. Document endpoints with JSON examples.
- **Provider/Service Management:** Admin can add multiple service providers via their API (name, URL, key) ³. Automatically import categories and services (including name, description, price, min/max, and if available, average delivery time). Support bulk import of categories and services from CSV or provider API. Admin can also create “manual” (fixed-price) services.
- **Dashboard (User & Admin):**
 - *User Dashboard:* Responsive UI showing current balance, active orders, history, and quick order form. Sort services by social platform (displaying platform icons). Show status, refill, or cancel buttons per order ⁴.
 - *Admin Dashboard:* Metrics (total orders, revenue, deposits) displayed in charts and widgets. **Example UI:** (see Fig. 1 below) an admin panel with navigation, stats, and management widgets ⁵. Features user management, service list, orders, tickets, logs.

Figure 1: Example Admin Dashboard UI (metric widgets, menus).

- **Ordering System:** Users can place one-time or scheduled orders. Support *drip-feed* (order slice every X hours) and *refill guarantee* (automatic top-up if drops occur) ⁶. Validate target links/handles. After order placement, deduct balance and queue order processing. Integrate webhook or polling to update order status (push-based notifications) ⁴. Provide an **Order History** table with details and quick actions (view invoice, refill, cancel).
- **Payments & Wallet:** Implement an internal wallet for users. Support Indian gateways (Paytm S2S, BharatPay, Razorpay) plus international (Stripe, PayPal) ⁵. Include crypto (BTC, ETH, USDT) if possible ⁷. Allow top-up (deposit), with optional bonus credit (e.g. "5–10% on deposit" bonuses) ⁸. Enable invoice generation and partial refunds for failed orders.
- **User Account & Security:** Email/password signup with **social login** (Google/Facebook) and CAPTCHA on public forms to block bots. Require email verification. Offer optional **2FA (TOTP/SMS)** for account security ¹. Implement roles (normal user, reseller, admin) with RBAC ¹. In user profile, manage API keys, passwords, and KYC documents (for large resellers).
- **Reseller & White-Label:** Allow users to create **reseller panels** (child panels) with custom branding (theme/colors/domain) ⁹. Resellers get their own API keys and documentation (v2) and can set their own service prices above base rates. Admin can track reseller commissions and payouts.
- **Ticketing System:** Integrate a support ticket system (users submit issues, admin/reseller replies). Track ticket status. Provide canned responses and attachments.
- **Internationalization:** UI must support multiple languages (e.g. English, Hindi, etc.). For example, PerfectPanel and many providers offer multi-language interfaces ¹⁰. Use resource files or a translation system.

Technical/Nonfunctional Requirements

- **Architecture:** Use a microservices or modular architecture for scale ². Key services: User/Auth, Order Processing, Payment, Notifications, Reporting, and Admin. Deploy on Docker/Kubernetes. Use caching (Redis) for rate-limiting and sessions. Implement message queues (RabbitMQ/AWS SQS) for order fulfillment tasks. Use a relational database (MySQL/PostgreSQL) for core data; optionally a NoSQL (MongoDB/Redis) for logging or analytics.
- **API Design:** RESTful JSON API with endpoints like:
 - `GET /api/v2/services` (list services),
 - `POST /api/v2/orders` (place order),
 - `GET /api/v2/orders/{id}` (order status),
 - `GET /api/v2/balance` (user balance) ¹¹. Use API key in headers or OAuth2. Enforce rate limits (e.g. 60 req/min). Provide OpenAPI/Swagger docs.
- **Security:** Enforce HTTPS and modern auth (JWT/OAuth tokens) for all APIs ¹². Hash + salt passwords, use prepared statements/ORM to prevent SQL injection. Sanitize all inputs. Implement CSRF protection on web forms. Follow OWASP best practices: strong auth (MFA, RBAC) and encryption for sensitive data ¹. Log all critical actions (login attempts, order actions, admin changes) for audit.
- **UI/UX:** Responsive design (desktop/mobile). Use a modern frontend framework (e.g. React/Vue) or Bootstrap/Tailwind. Provide intuitive navigation (side menu or tabs). On category/service pages, display platform icons (Facebook, Instagram, etc.) for clarity. Include a dark/light theme switch. Ensure accessibility (alt tags, labels).

Figure 2: Example responsive dashboard (React/Tailwind) showing how layout adapts to different screens.

- **Admin Controls:** Full admin panel for configuration:
- **User Management:** Search, filter, ban/unban, set balances.
- **Service Management:** Create/edit categories and services (with icons), import via CSV or provider sync ¹³. Enable/disable items.
- **Provider Sync:** Manage API providers, test connections, set priority for orders.
- **Settings:**
 - **SEO/Pages:** Edit site title, meta tags, static pages (About, TOS).
 - **Payments:** Configure gateways, transaction fees.
 - **Notifications:** Email/SMS templates and triggers.
 - **Localization:** Edit language packs, currency formats.
 - **Themes/Files:** Upload logos, background images, custom CSS/JS.
 - **Modules:** Enable/disable features (e.g. enable “Refill”, “Coupons”, etc.).
 - **Analytics:** View logs and metrics (e.g. new users, sales charts) ¹⁴.
- **Compliance:** Include GDPR opt-in, logs of consent. Allow users to delete data on request. Display Terms & Privacy (editable by admin) ¹⁵. Ensure PCI-DSS compliance for payments.
- **Monitoring & Testing:** Integrate monitoring (Prometheus/Grafana) for uptime and performance. Use CI/CD with automated tests (unit/integration) and security scans (SAST/DAST) ¹.

Example Developer Prompt

Design and implement a **SaaS Social Media Marketing (SMM) panel** with the following specifications:

- **API Compatibility:** Support PerfectPanel-compatible APIs (v1/v2) for resellers. Include endpoints for listing services, placing orders (single and bulk), checking status, and retrieving balance. Provide secure API key/token authentication and rate limiting. Document these endpoints in Swagger (JSON format) for resellers.
- **Service & Provider Management:** Admin can add multiple third-party SMM service providers (name, base URL, API key). The system should fetch and bulk-import service categories and items from providers (with descriptions, prices, min/max, and estimated delivery time). Admin can also manually create categories/services. Display platform icons (Facebook, Instagram, etc.) on categories and services.
- **User Accounts:** Implement user registration with email/password plus social logins (Google/Facebook) and CAPTCHA on signup. Offer optional 2FA (TOTP). User dashboard shows current balance, quick top-up button, and a responsive list of available services (sortable by platform category with icons). Show order history table with columns: Date, Service, Quantity, Status, and actions (View,

Refill, Cancel).

- **Ordering & Refill:** Support instant and scheduled (drip) orders. When placing an order, validate the target link/handle. Deduct amount from wallet, queue the order, and call provider APIs. Update order progress live (use webhooks or polling for push updates)
④. If providers return failures or drops, automatically refund or refill within the guarantee window ⑥.
- **Ticket System:** Include a support/ticket module where users/resellers submit issues. Tickets have status (Open, In Progress, Closed) and admin replies via an interface.
- **Reseller Features:** Allow any user to become a reseller/child-panel owner with custom branding (logo, theme, subdomain) ⑨. Resellers get their own API credentials (with token generation) and can set their own pricing. Maintain an affiliate/reseller tracking system for commissions.
- **Payments:** Integrate international and Indian payment gateways. Example: **Razorpay** (cards, UPI), **Paytm S2S**, **BharatPe**. Also include Stripe/PayPal. Use a wallet system: users deposit funds to wallet and pay orders from it ⑧. Issue invoices/receipts and allow refunds on failed orders. Optionally support cryptocurrencies (BTC/ETH/USDT) ⑦.
- **Admin Panel:** Provide full control over all aspects. Features include:
 - User management (view/search users, adjust balance, set status).
 - Service/provider management with CSV import/export.
 - Site settings (SEO tags, language, currency options).
 - Notification settings (email templates, provider alerts).
 - Theming (custom CSS/JS, animations, pop-up banners).
 - Logs and audit trail of admin actions.
 - Analytics dashboards (orders per day, top services).

Use a modern tech stack (e.g. Laravel or Node.js backend, React/Vue frontend). Ensure security best practices: CSRF protection, input sanitization, HTTPS, strong auth with 2FA and RBAC ①. Follow microservices principles for scalability ②.

Deliver wireframes/mockups for both user and admin dashboards and specify data models (ER diagram). For example, show `User`, `Order`, `Service`, `Provider` tables and key fields. Outline sample API requests (JSON) for placing an order and checking status. The system should be production-ready and cloud-deployable.

References: A successful panel may include features like bulk ordering and refill guarantees ⑥ ④, multi-language support ⑩, and analytics in the admin dashboard ⑭. Use these as guidelines in your design.

Sources: Vendor sites (PerfectPanel, HonestSMM) and GitHub panels (e.g. SMMBooster ¹³ ³) highlight needed features like API support, dynamic services, and admin tools. Industry guides emphasize API/webhook best practices ⁴ and strong security (MFA, RBAC) ¹. These informed the above prompt.
